

Harlan County Lake 1999 Water Quality Report

1. General.

a. Project location. Harlan County Dam is located at river mile 232.3 of the Republican River about 8 miles east of Alma, Nebraska. The watershed encompasses 7,169 square miles in south-central Nebraska.

b. Authorized project purposes. Flood control, irrigation, and water quality are the primary project purposes; equally important, however, are its fish and wildlife resources and recreation benefits.

c. Pertinent data.

Pools	Surface Elevation (ft. above m.s.l.)	Current Capacity (1,000 A.F.)	Surface Area (acres)	Shoreline (miles)
Flood	1,973.5	496.7	22,820	
Multipurpose	1,946.0	315.1*	13,262	75
Inactive		159.1**		
Total		811.8		

Total Drainage Area: 7,169 sq. miles

Average Annual Inflow: 258,658 acre-feet

* Estimated based on most recent hydrographic survey

** Contained in multipurpose pool.

2. Activities and studies of the year.

Monthly herbicide and nutrient sampling was conducted by lake project personnel, with technical and analytical support from PM-PR-W, April-September 1999 at one inflow station, three lake stations (two depths), and the outlet. Nutrient samples were shipped to the Chemical and Materials Quality Assurance Laboratory (CMQAL) in Omaha for analysis while the herbicide samples were shipped to the PM-PR-W laboratory for analysis of four of the most commonly occurring herbicides by the ELISA (enzyme linked immunosorbent assay) method. Ten percent of the herbicide samples were shipped to CMQAL to be analyzed by GC (Gas Chromatography) for quality control purposes. All generated data were entered in excel spreadsheets as an interim to the EPA national water quality data management system, NEW

STORET, which is still in the development stage. Table 1 at the end of this report includes all the available nutrient and herbicide data for the past years from 1996-1999.

The OF-HC is to be commended for its continued support of water quality monitoring of Harlan County Lake and its tributaries. The OF-HC personnel deserving special recognition include Messrs. Larry Janicek, Jim Brown, and Jim Bowen.

3. Existing conditions.

FIGURE 1: HC-8

a. Inflow.
During the six-month sampling period the calculated total nitrogen (TN) concentrations (i.e., NH_3 , + NO_2 + NO_3 + TKN) in the inflow waters to Harlan County Lake (station HC-8) continue to exhibit eutrophic conditions with a mean, minimum and maximum of 2.64 mg/L, 1.30 mg/L, and 3.67 mg/L, respectively. Total nitrogen concentrations for the period of record have generally exceeded the Environmental Protection Agency (EPA) criterion for the protection of aquatic ecosystems from excessive eutrophication (<1mg/L) and have demonstrated the

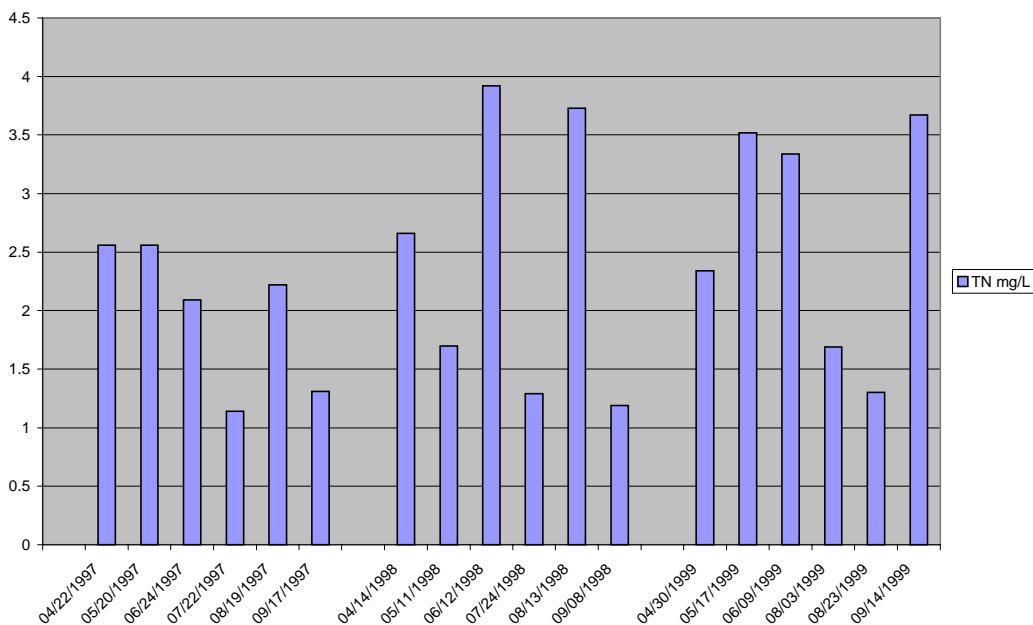

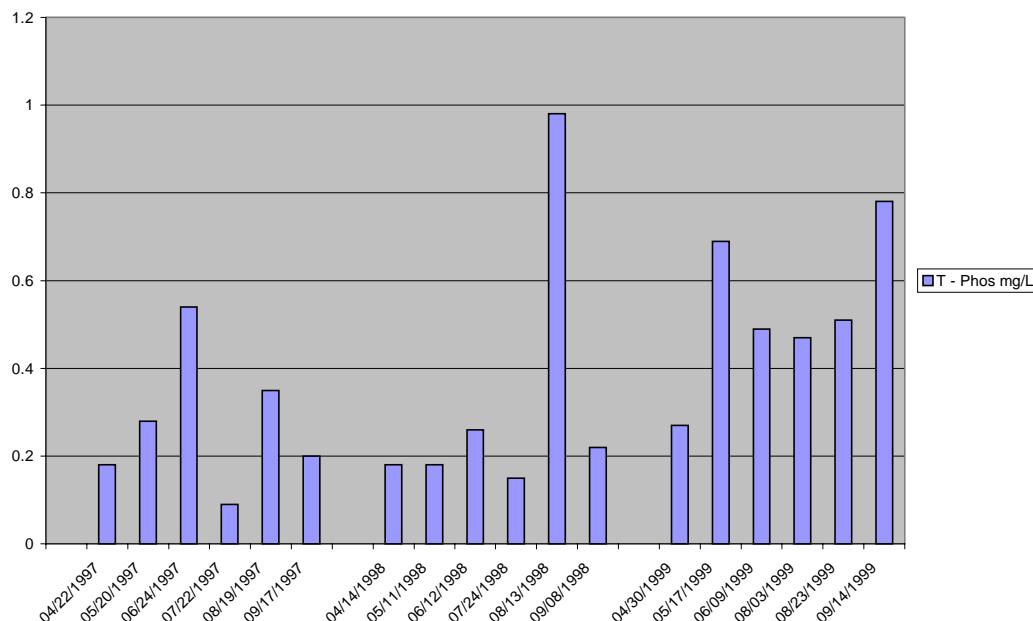

FIGURE 2: HC-8

elevated, long-term, nutrient loading to the stream. Figure 1 shows the trend for total nitrogen concentrations over the past three years. Spikes typically occur during high inflows such as May, June and September 1999. The 1999 total phosphorus (TP) concentrations reflected highly enriched conditions (mean, minimum, and maximum concentrations of 0.54 mg/L, 0.27 mg/L, and 0.78 mg/L, respectively). These concentrations were also higher than the EPA suggested stream criterion of 0.1 mg/L for the protection of aquatic ecosystems. The stream has been characterized by hypereutrophic phosphorus levels over the period of record. Figure 2 shows this trend for the past three years.

FIGURE 3: HC-8

The four herbicides (atrazine, metolachlor, alachlor, and cyanazine) were also detected in the inflow waters. Atrazine was detected in 100% of the samples with a mean and maximum concentration of 1.57 ug/L and 3.12 ug/L, respectively.

One of the samples exceeded the EPA maximum contaminant level (MCL) of 3 ug/L for drinking water. The trend for the past four years is shown in figure 3. Alachlor and cyanazine were detected but quantities were so low, neither was in danger of exceeding the established criteria of 2 ug/L for alachlor and 1 ug/L for cyanazine.

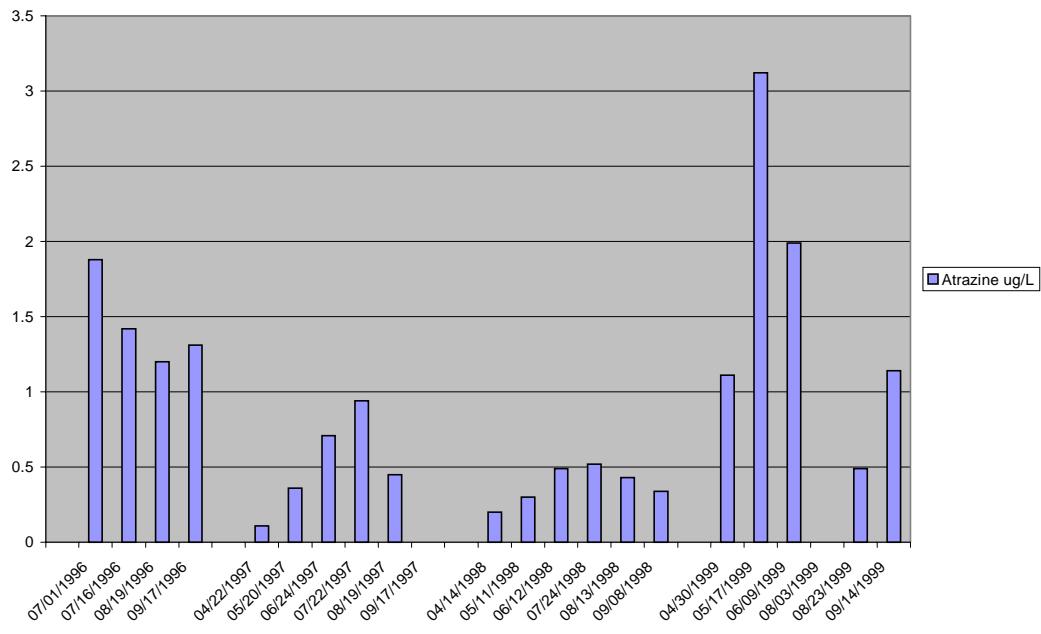

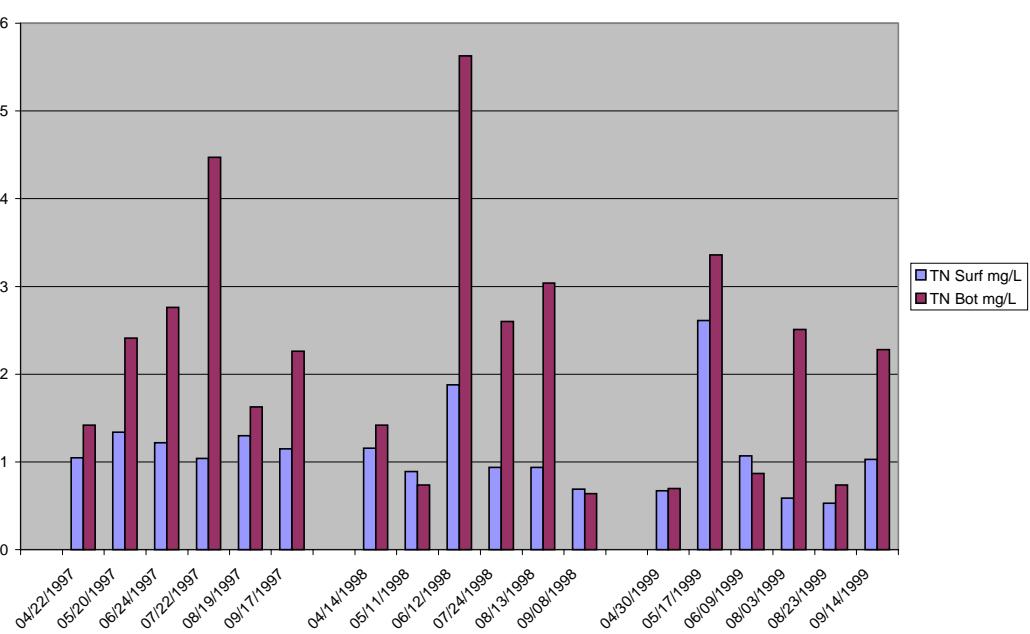

FIGURE 4: HC-2

Metolachlor concentrations were also low, however, without an established MCL, their significance can not be judged.

b. **Lake.** Stations HC-2 (downlake), HC-4 (midlake), and HC-7 (uplake) were sampled

during the six-month sampling period from mid April-September. The 1999 calculated

TN concentrations in the lake ranged from moderately enriched in the downlake and midlake sections to highly enriched in the uplake region of the lake. The mean, minimum, and maximum TN concentrations in the surface waters were downlake, 1.08 mg/L, 0.53 mg/L, and 2.61 mg/L; midlake, 1.26 mg/L, 0.70 mg/L, and 2.63 mg/L; and uplake, 1.61 mg/L, 0.65 mg/L, and 2.62 mg/L, respectively. TN concentrations in the bottom waters were

more highly enriched with mean, minimum, and maximum concentrations of 1.74 mg/L, 0.70 mg/L, and 3.36 mg/L, respectively, at HC-2, 1.96 mg/L, 0.79 mg/L, and 3.58 mg/L, respectively, at HC-4,

FIGURE 5: HC-4

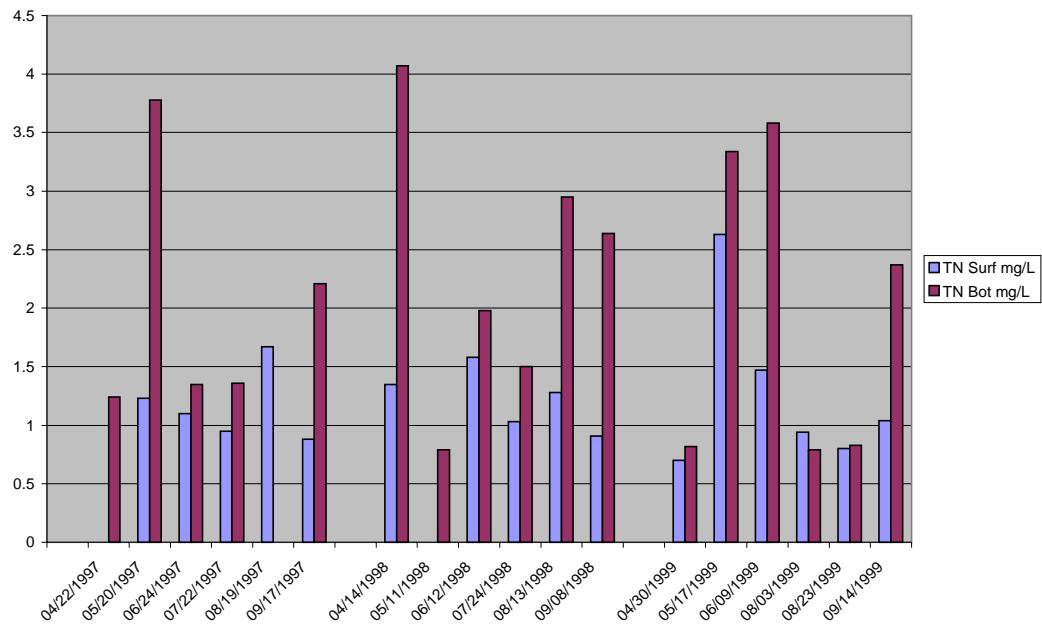

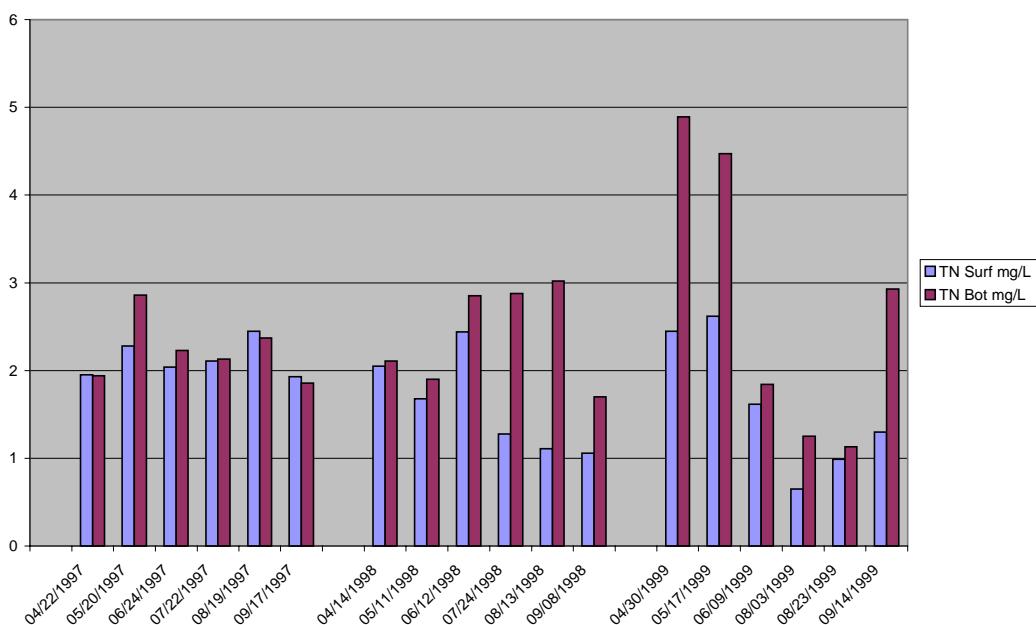

FIGURE 6: HC-7

and 2.75 mg/L, 1.13 mg/L, and 4.89 mg/L, respectively, at HC-7. Figures 4, 5, and 6 show the relationship between the total nitrogen

FIGURE 7: HC-2

concentrations of these three lake stations over the past three years. As can be seen from these three graphs, concentrations at bottom depths are equal to or greater than those at the surface. The high spikes can be attributed to high inflows and temperature

differences between surface and bottom waters. Ninety-seven percent of the 1999 total phosphorus concentrations exceeded the EPA generalized eutrophy criterion for lakes of 0.05 mg/L. The mean TP concentrations in the surface waters of the lake were downlake, 0.09 mg/L; midlake, 0.11 mg/L; and uplake, 0.26 mg/L. Mean TP concentrations were greater in the bottom waters with means of 0.49 mg/L, 0.61 mg/L, and 0.67 mg/L, respectively. The 1999 data continue to show enriched conditions

throughout the lake.

Figures 7, 8, and 9 show total phosphorus

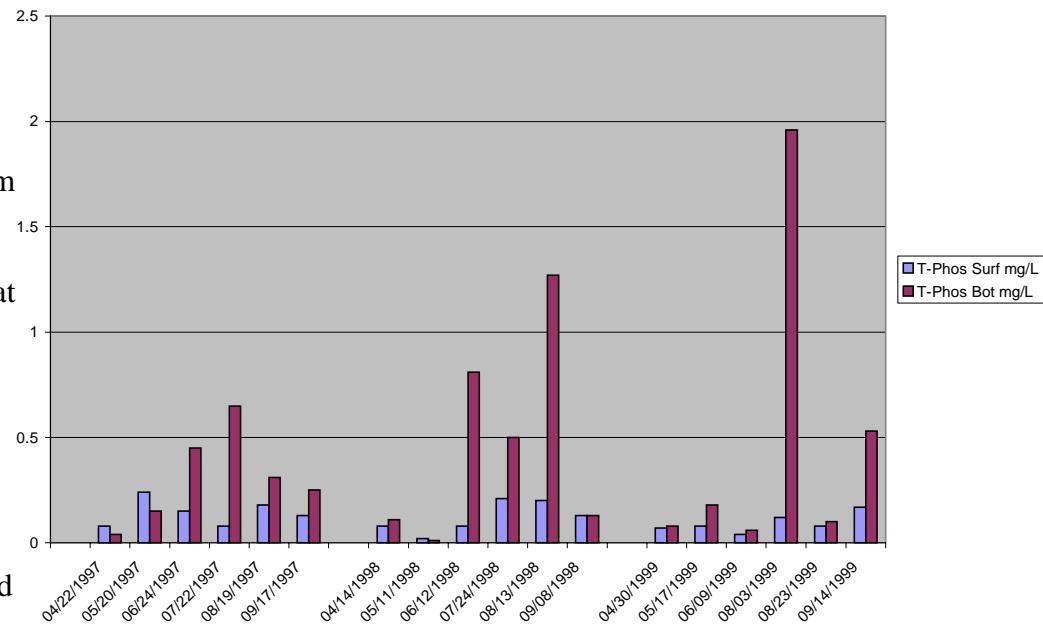

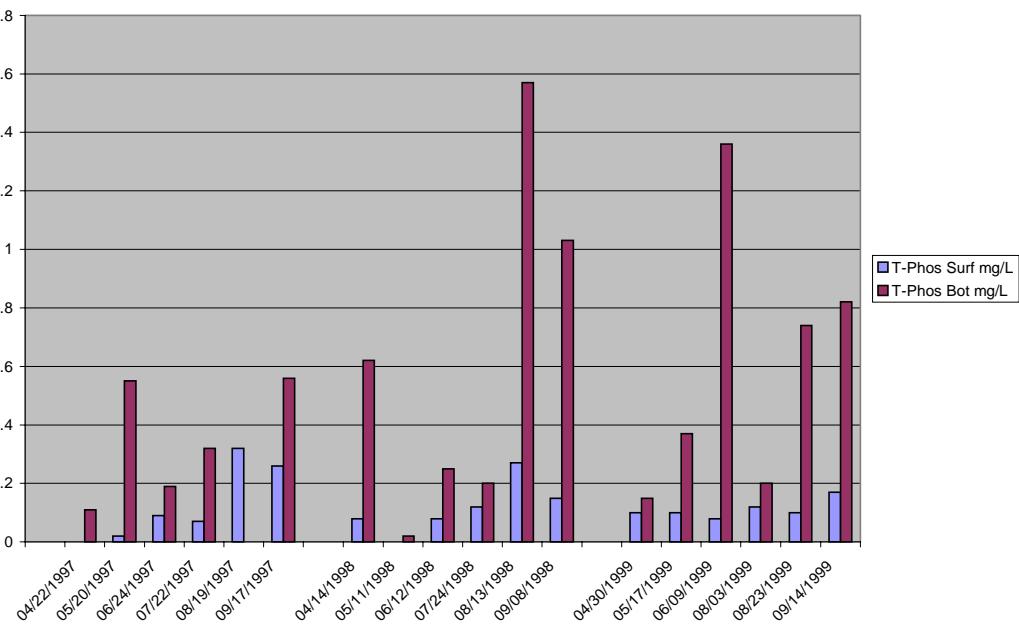

FIGURE 8: HC-4

concentrations at the surface

and bottom depths throughout the lake 1997-1999. Total phosphorus concentrations tend to

follow the same pattern as the total nitrogen concentrations with spikes appearing during the same sampling periods. Again these can be

FIGURE 9: HC-7

attributed to high inflows and temperature differences between surface and bottom waters. The 1999 total phosphorus

concentrations followed the long-term trend with 97% of

the concentrations equaling or exceeding the EPA generalized eutrophy criterion for lakes of 0.05 mg/L.

In the monthly sampling, the four herbicides (atrazine, metolachlor, alachlor, and cyanazine) were detected at all three lake stations. Atrazine was detected in 100% of the samples. Only one of the samples of atrazine exceeded the MCL of 3 ug/L for drinking water but thirty-nine %

of the samples exceeded the 1 ug/L criterion for the protection of aquatic life. The mean and maximum atrazine concentrations in the surface waters of the lake were as follows, 0.86 ug/L and 1.14 ug/L (HC-2); 0.98 ug/L and 1.33 ug/L (HC-

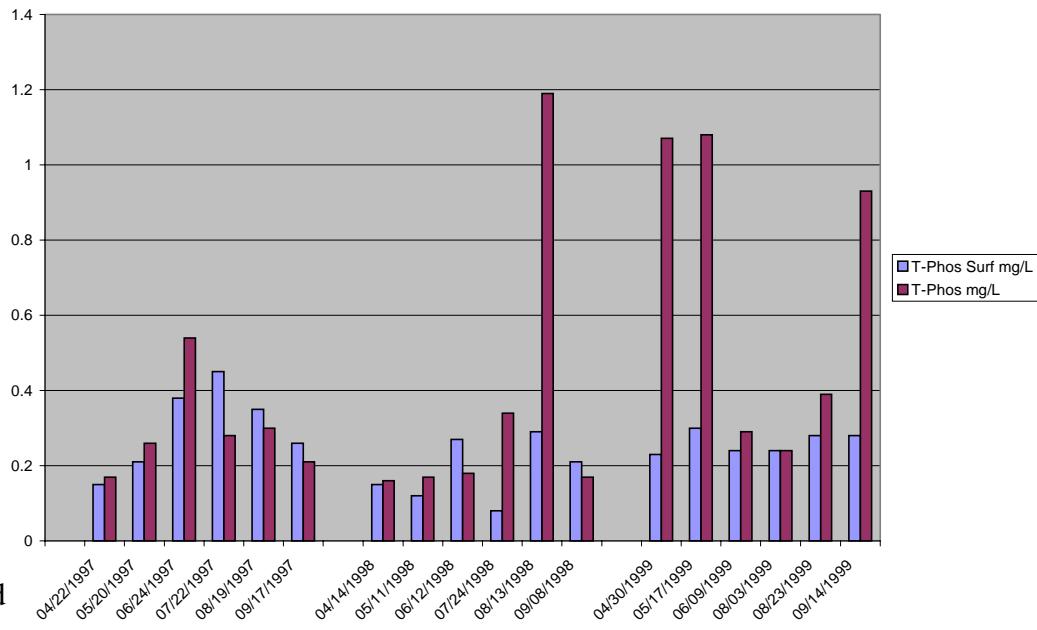

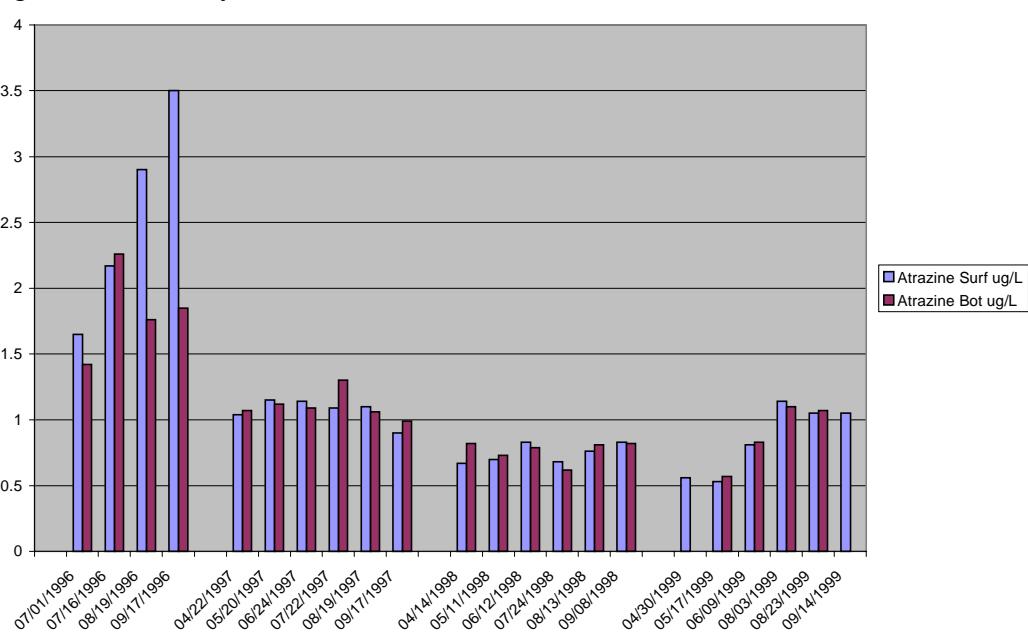

FIGURE 10: HC-2

4); 1.51 ug/L and 2.57 ug/L (HC-7), respectively. Bottom mean and maximum atrazine concentrations for the above areas were as follows, 0.89 ug/L and 1.10 ug/L; 1.01ug/L and 1.29 ug/L; 1.51 ug/L and 3.08 ug/L, respectively. Figures 10, 11, and 12 show the trend for atrazine concentrations for the years 1996-1999. As can

FIGURE 11: HC-4

be seen from these graphs, high concentrations occur throughout the lake in early spring during high run-off periods. For the most part, concentrations are uniform throughout the water column. Although alachlor was detected in

72% of the samples and cyanazine was detected in 100% of the 1999 samples,

neither exceeded established criteria. Metolachlor also was frequently detected (86% of the samples) in very low concentrations.

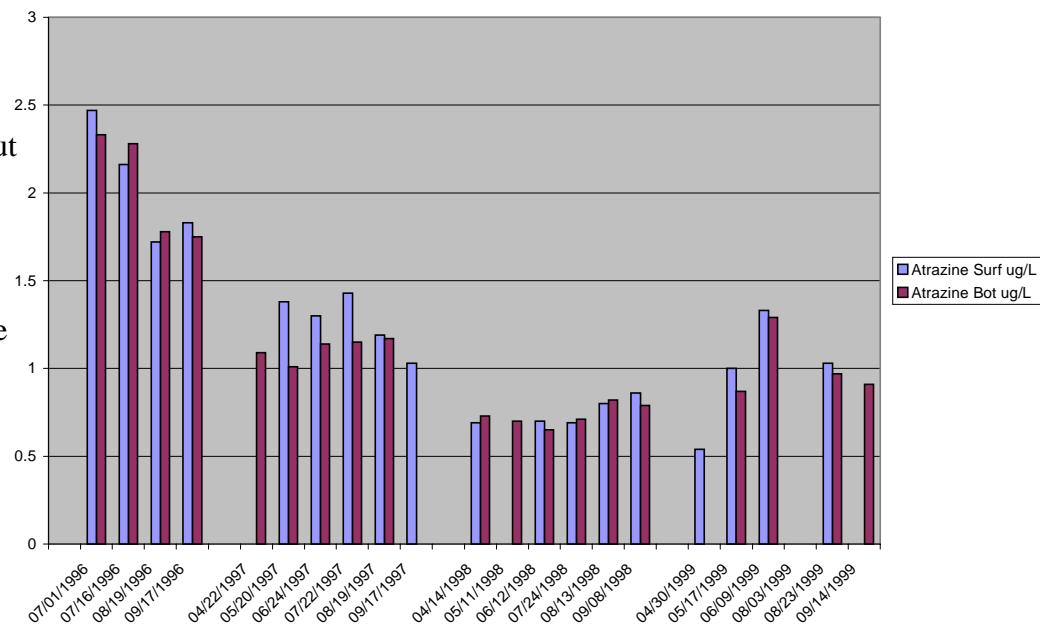

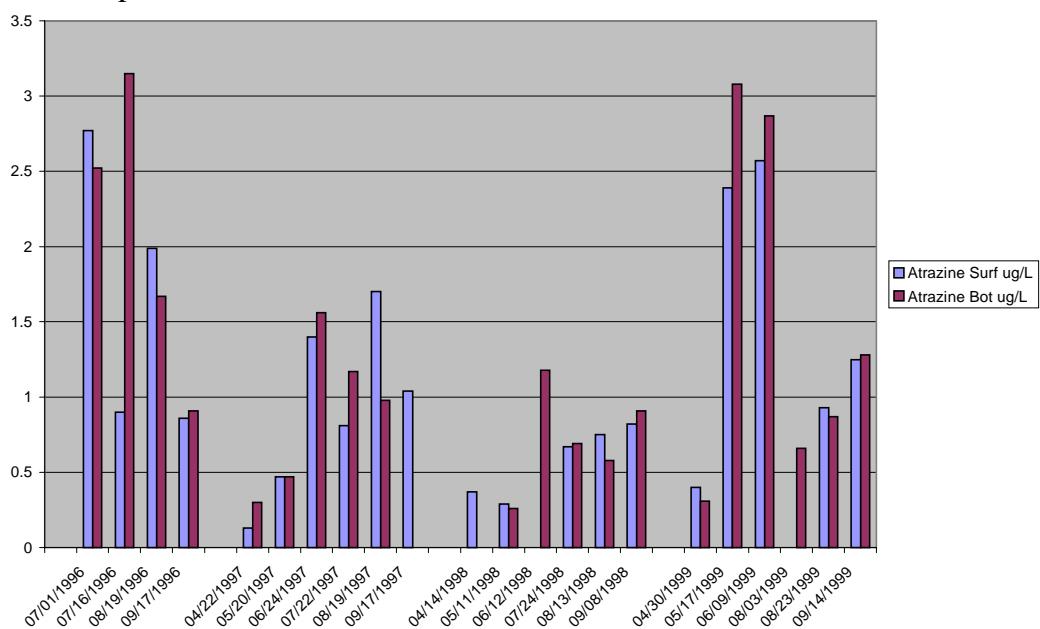

FIGURE 12: HC-7

c. **Outflow.** The nutrient levels remained moderately to highly enriched with mean total nitrogen and total phosphorus concentrations of 1.17 mg/L and 0.11 mg/L,

respectively.

Again, as shown in figures 13 and 14, concentrations are higher during the high run-off periods. Of the four pesticides atrazine and cyanazine were detected in 100% of the samples. None of the four herbicides

exceeded any established criteria, however, atrazine had the greatest concentrations. The mean and maximum atrazine concentrations in the released waters were 0.77 ug/L and 1.13 ug/L,

respectively. Figure 15 shows the trend for the years 1996-1999. As can be seen from this graph, concentrations of atrazine in the outlet have been fairly consistent for the past three years.

FIGURE 13: HC-1

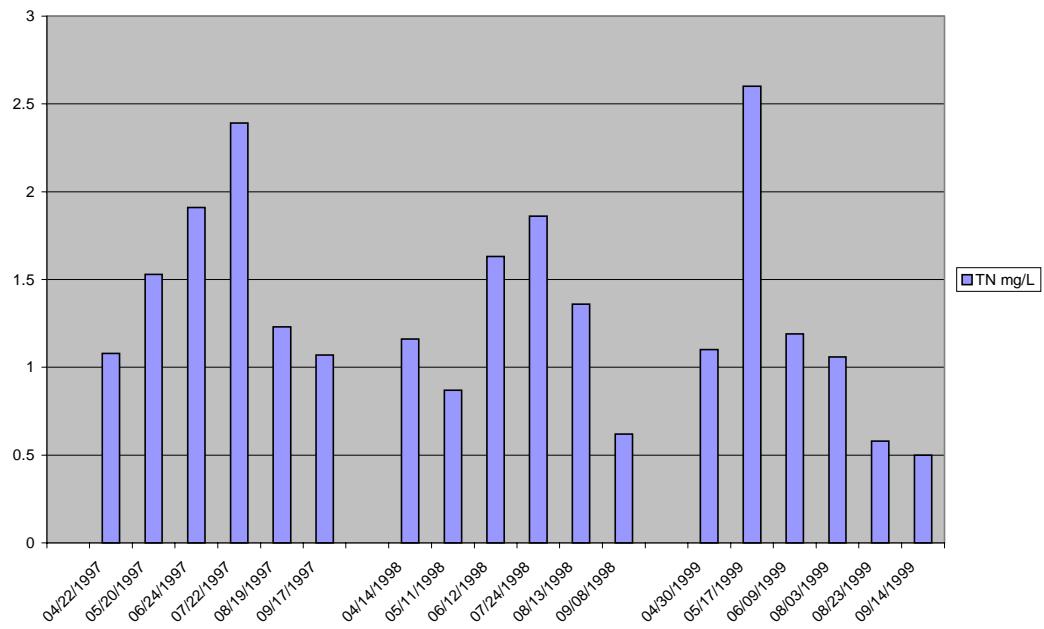

FIGURE 14: HC-1

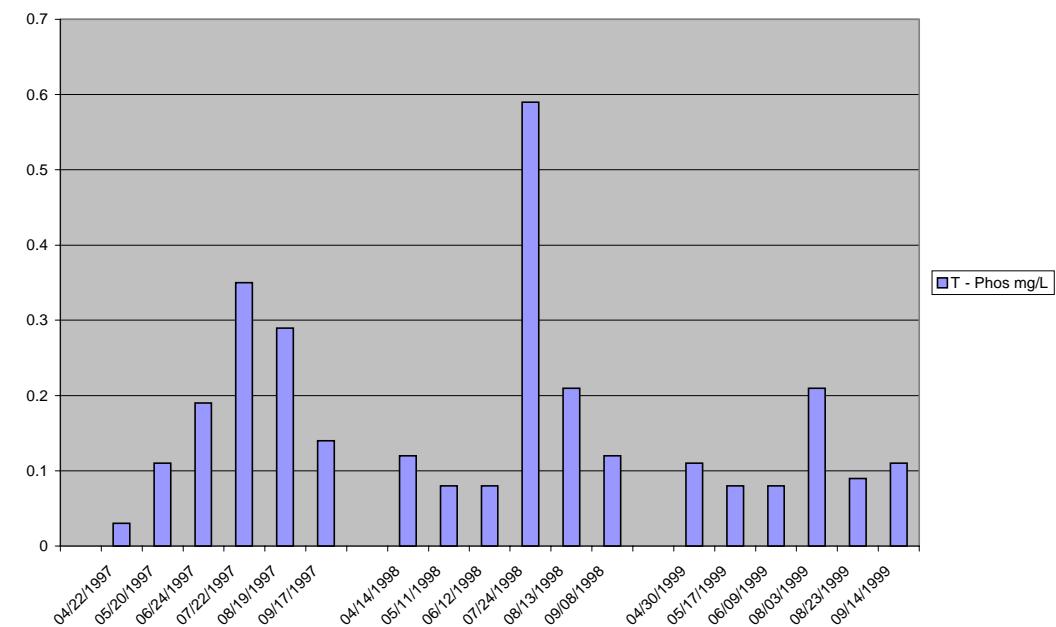

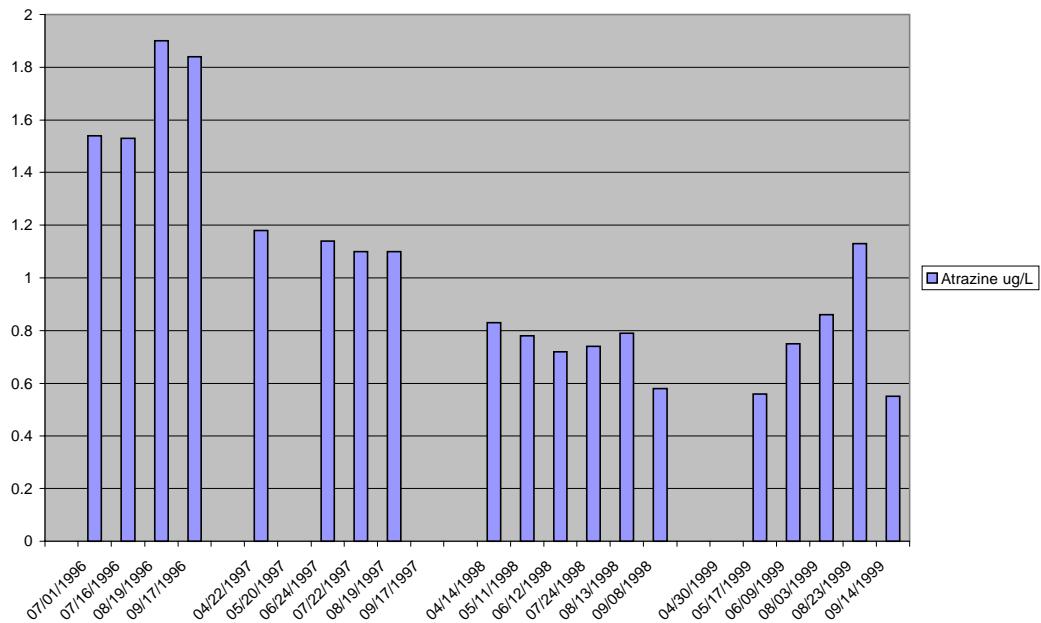

FIGURE 15: HC-1

4. Future conditions.

The water quality concerns of Harlan County Lake continue to center around heavy suspended solids, nutrient, and pesticide loading in the old impoundment. The tremendous sediment load entering the reservoir during storm events will continue to be the major impairment to water quality until soil conservation practices and crop- and livestock-production strategies are altered. The increased turbidity, suspended solids, nutrients, and pesticides from point and non-point sources will ultimately reduce the reservoir's water quality and project benefits.

5. Recommendations.

With the current staffing and funding levels, the water quality surveillance program for Harlan County Lake will continue to be limited to monthly surveillance of herbicides by the Project personnel with logistical and analytical support from PM-PR-W. Although there is little current support for its implementation, the District should continue to promote an expanded, cooperative, water quality monitoring and abatement program for Harlan County Lake and its watershed similar to the one currently underway for Hillsdale Lake and the Big Bull watershed.
